

CS411 Weekly Report

Iron Team TasteBuddies

Weekly Development Report # 7

Performance Period: Wednesday 2/27 through Tuesday 3/4

Group Accomplishments:

Individual Contributions/Accomplishments: (to be filled out by each individual)

Colette Woods:

-  Presented with the team, they're pretty cool folks.
-  Added content to the Poster, it looks terrible, but it's a start

Grant Fitch:

-  Worked on Poster, it looks better than Colette thinks
-  Began working on dish recommendation algorithm
-  Revisited User Login and Account creation to deal with case sensitivity and dot indifference

Ashley Barasebwa:

-  Presented Prototype Demo 1 with Team
-  Working on implementing and maintaining data privacy measures

Ben Nissley:

-  Presented Prototype Demo 1 with Team

Oronde Brown:

-  Presented with the team
-  Started planning out dish reviews and getting friends in tastebuds section

Nathanael Donald:

-  Presented Prototype Demo 1 with Team
-  Helping Ashley create a soft delete for user info in the database.
 1. Anonymous the user by setting their name to TasteBuddy {user_id}.
 2. Change the email to tastebuddy{user_id}@tastebuddies.com
 3. If we implement hashed passwords, change it to some deleted account default password.
 4. The reason for all this is we would like to keep their review data to help bolster our matches and recommendations after they delete their account.
-  Lots of brainstorming with Grant
 1. how to normalize emails for inputting into the database.
 2. How to organize work on github projects. (one branch for one issue, as Andrew suggested).

CS411 Weekly Report

3. How much mock data should we have and how to automate creation without it seeming algorithmic for the demo.
4. Using reviews from taste matches to recommend dishes to users vs matching users to dishes by using the dish taste profile (We can use both approaches if we figure it out).
5. Following users (instagram approach) vs friend requests (Facebook approach), Group decided on instagram approach. We think this makes more sense since tasteBuddies is basically an influencer app.

🔧 Applying the "Andrew Approved!" DB changes.

I'm also adding this to this week since I started it at the end of the last week and it carried over. I'm going to add a reason for these changes since I think it's important to have justification for work. The main reason for the changes is we found that our friends list did not work. It only allowed a user to have one friend at a time so we added a junction table to allow a user to have multiple friends. This is important because our app relies on people being able to find and add relevant tastebuddies. I basically had all the foreign IDs inverted so nothing was really working as it should. The solution was to just move the user id to all the other tables. Everything else was to make life easier for the rest of the team when we start to connect more elements from the frontend to the database, such as the reviews or the group matching that Oronde and Ashley are tackling next week.

1. Adding taste_comparison table.
2. index for taste_comparison.
3. Separate dish_taste_profile table from taste_profile.
4. Junction tables that work (saved_dishes, saved_restaurants, friends, cuisine, dish_menu_junction). Currently they only really allow one user to be friends with one user.
5. Moving all foreign keys out of the user table and adding user ID foreign keys to all those tables removed from the user. Basically had all the relationships reversed.
6. Validated all the changes and updated any parts of the code that broke.
7. Proper constraints and relationships for everything.

🔍 Issues/Concerns: Examples below...
